TerriTool Voice Mode

Your field day, one conversation.

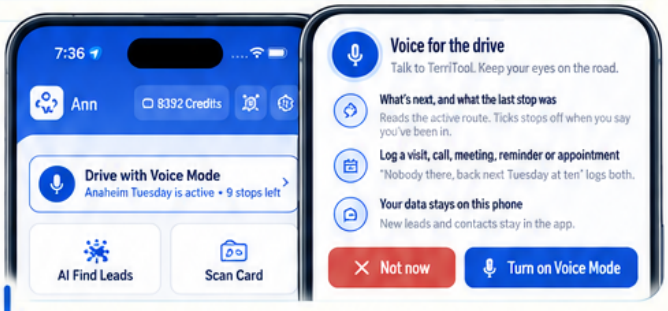

More Ground Ahead.

Use your phone speaker & mic

For the clearest conversation, use your phone speaker and microphone.

1 Turn it on

Tap Drive with Voice Mode on Home.
Tap Turn on Voice Mode.
Allow microphone access.

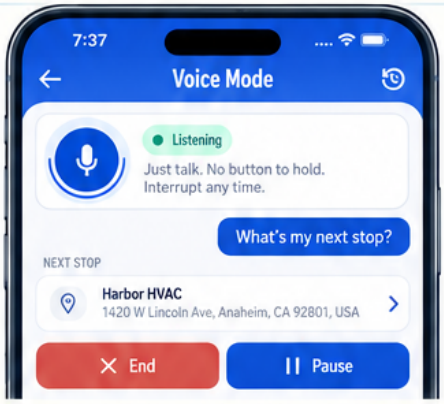

2 Speak naturally

Wait for Listening, then just talk.

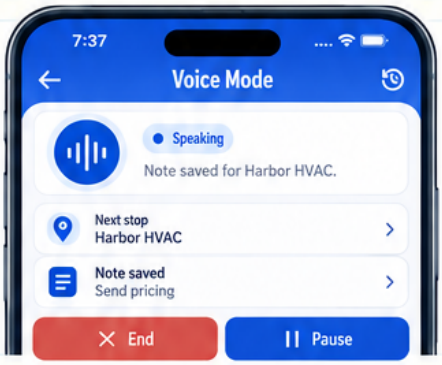

"What's my next stop?"

"Add a note to Harbor HVAC: send pricing."

3 Hear it. See it.

Get a spoken answer and on-screen results.

4 Pause or finish

Pause stops listening. Resume continues.
End closes the voice session.

End | Resume

Know what's happening

Listening → Working → Speaking → Paused

Listening — **Working** — **Speaking** — **Paused**

Working appears when TerriTool reads or saves information.

Voice stays on as you move between TerriTool screens.
New lead and contact searches happen in the app.

Same work. A smoother day.

THE EXPERIENCE

Voice Mode, from start to finish

A practical guide for field reps, product teams and engineering. Six complete journeys, all nine states, settings and the system architecture.

One conversation. One active session.

Turn Voice on once, speak naturally, and hear the result. The microphone stays open while listening. Pause or End gives the user control.

The everyday flow

1	>	2	>	3	>	4
Turn on		Speak		See + hear		Pause / End

Every on-screen state

Off	No active session. Tap Turn on Voice Mode.
Connecting	Establishing the voice connection.
Listening	Microphone open; ready for the next request.
Hearing you	Your speech is being detected.
Thinking	Preparing an answer or the next action.
Working	Reading data or running a business action.
Speaking	Playing the spoken response.
Paused	Microphone and playback stopped; session kept.
Error	Voice needs recovery. Reconnect or End.

Recommended audio

Use the phone speaker and microphone. Keep “Use the phone speaker” on; Bluetooth or car audio may affect recognition and response time.

JOURNEYS 01-02

Start, visit, move forward

Example phrases are illustrative. Spoken wording may vary; a successful backend result determines whether a change was saved.

JOURNEY 01

First use to first answer

Entry: an active route, or the dashboard's Drive with Voice Mode row.

1. **Open Voice.** Tap the route microphone or Drive with Voice Mode.
2. **Enable it.** Read the first-use explanation, tap Turn on Voice Mode, and allow microphone access. Not now dismisses setup.
3. **Wait for Listening.** Connecting changes to Listening. If access is denied, allow the microphone in device settings before retrying.
4. **Ask a question.** "What's my next stop?" TerriTool reads the route and gives a spoken answer with a next-stop card.
5. **Finish or continue.** Ask another question, open the stop card, or tap End to release the microphone.

Outcome: The user understands how to start and finish a hands-free conversation.

JOURNEY 02

Prepare for a visit, then log it

Entry: Voice is listening and the user has an active route.

1. **Prepare.** "Tell me about CineOpera." Then: "Read its latest notes." Saved company information is retrieved.
2. **Meet the customer.** Tap Pause before the conversation. Tap Resume afterward.
3. **Record the visit.** "Log a visit at CineOpera. The owner asked for pricing." A successful save produces a Logged card.
4. **Update route progress.** "Mark CineOpera visited on my active route." The next-stop information refreshes.
5. **Move on.** Ask "What's next?" Repeat for the next stop, or tap End.

Outcome: The activity is recorded and the route stop is marked visited. These are separate operations.

JOURNEYS 03-04

Follow up and plan a route

Voice works with saved companies, notes, known contacts, activities, lists and routes. New lead or contact discovery stays in the app.

JOURNEY 03

Save a follow-up and review it

Entry: the user starts Voice and identifies a saved company.

1. **Find the account.** “Find my saved company CineOpera.” Use a clear company name to identify the record.
2. **Capture the note.** “Add a note to CineOpera: interested in the premium package.”
3. **Schedule the follow-up.** “Add a reminder for CineOpera on October 6 at 10 AM to follow up on pricing.”
4. **Verify and edit.** “What activities are scheduled for CineOpera?” Review the response and request a specific edit if needed.
5. **Finish.** Tap End. The saved note and activity remain in TerriTool.

Outcome: The follow-up is stored against the company. Activity types include Visit, Call, Meeting, Reminder and Appointment.

JOURNEY 04

Build a route from saved accounts

Entry: the required companies already exist in the user’s saved accounts.

1. **Choose accounts.** “Create a list called Tuesday Visits with CineOpera and Baroo.” Or ask to read an existing saved list.
2. **Build the route.** “Create a route from Tuesday Visits, starting at CineOpera and ending at Baroo.”
3. **Wait for completion.** Voice shows Working while route creation runs. Continue after a confirmed result.
4. **Activate explicitly.** “Open the Tuesday Visits route.” Then ask “What’s my next stop?”
5. **Use the route.** Continue with stop questions and visit updates. Tap End when finished.

Outcome: A route is created from saved accounts and opened for the field day. Ask to show the route to access its result card.

JOURNEYS 05-06

Keep working. Recover clearly.

The voice session is shared across TerriTool screens. Moving away from the full Voice screen does not end it.

JOURNEY 05

Move between voice and app screens

Entry: Voice is active while the user reviews a company or route.

1. **Open a detail screen.** Tap a stop or result card. A mini-bar keeps the voice state and Pause/Resume controls visible.
2. **Request new leads.** “Find new bakeries in Anaheim.” Voice explains that new lead discovery happens in the app.
3. **Continue in the app.** Tap AI Find Leads > Open. Complete the search in that screen; Voice stays active unless paused.
4. **Return and finish.** Tap the mini-bar to reopen Voice, then continue talking or tap End.

Outcome: Users can switch between spoken assistance and visual tasks. Contact-discovery requests currently open the same lead screen; that handoff needs correction.

JOURNEY 06

Screen off, interruption or lost signal

Entry: Voice is active. Background listening depends on the chosen setting and device support.

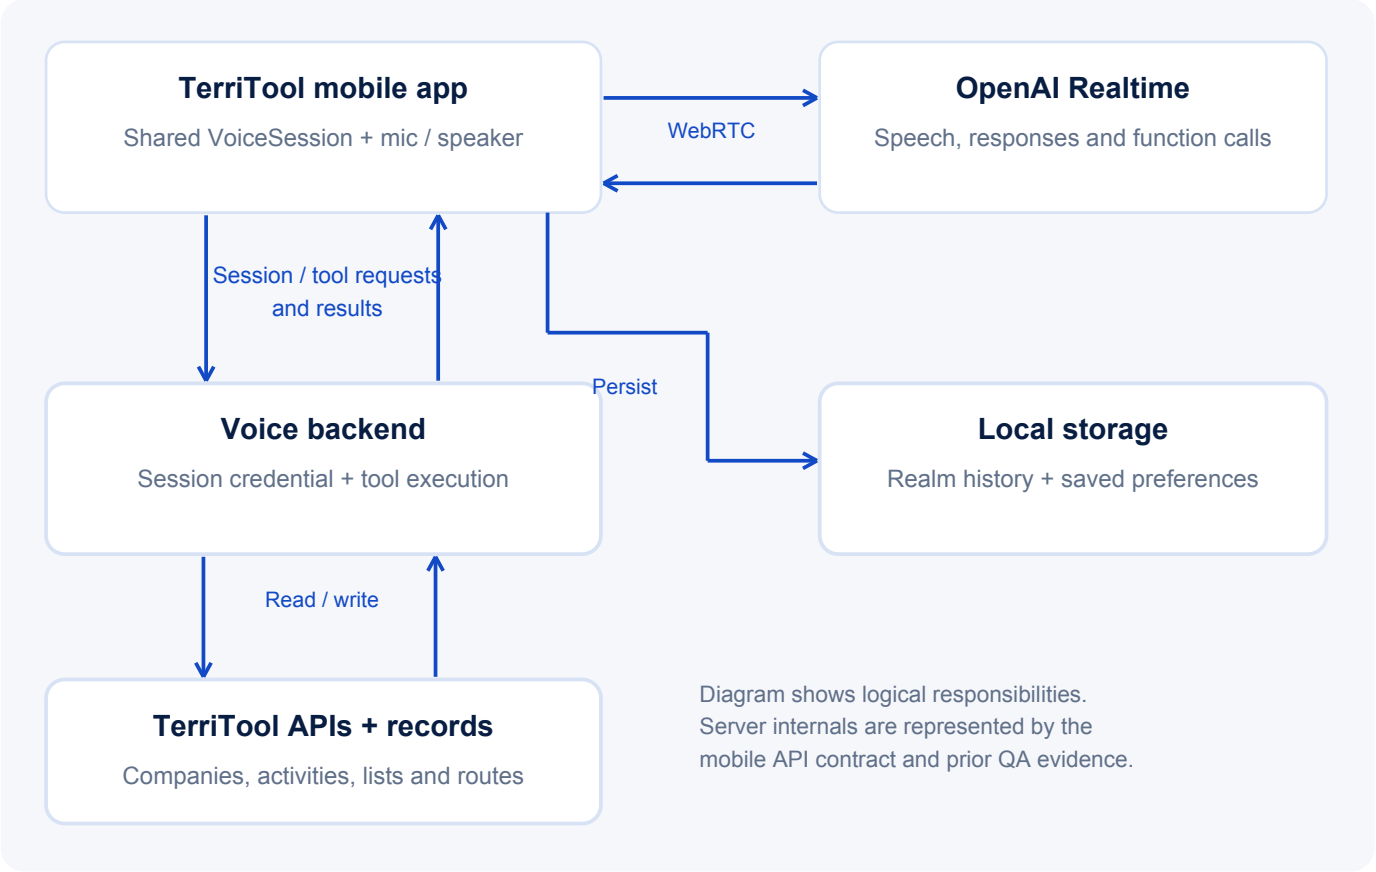

1. **Lock the screen.** With Keep listening with the screen off enabled, the implementation is designed to continue background audio.
2. **Handle interruptions.** A call or loss of audio focus pauses Voice; the implementation resumes when audio returns.
3. **Recover a connection.** After a connection loss, Voice attempts recovery. If it fails, use Reconnect when connectivity returns.
4. **Check an uncertain save.** If a write result is unknown, read Check before repeating and open the record before repeating the command.
5. **Resume or finish.** Continue once Listening returns, or tap End. Reconnection starts fresh model context, so restate key details if needed.

Outcome: The user has a recovery path without blindly repeating a possible save. Real-device background audio and interruption behaviour still require validation.

SYSTEM ARCHITECTURE

How speech becomes an action

Audio travels directly between the phone and OpenAI. Business operations go through the voice backend and TerriTool APIs.

One request, end to end

1. **Start.** The signed-in app requests a short-lived client credential from GET voice/session.
2. **Connect.** The phone opens WebRTC. Audio and control events use the realtime connection.
3. **Execute.** A model function call is sent to POST voice/tool. The backend performs the permitted business operation.
4. **Return.** The app renders result cards and sends the model its result payload for the spoken response.
5. **Remember.** Transcript history is stored locally. Business changes persist in TerriTool; model context is trimmed separately.

CONTROLS, SCOPE AND EVIDENCE

What to tell users

The distinction between an implemented flow and a field-validated experience should remain clear when sharing this guide.

Settings and session controls

Phone speaker	Default on. Requests the phone speaker and microphone, including when Bluetooth is connected.
Screen-off listening	Default on. When off, backgrounding pauses Voice; returning to the app resumes it.
Start on route open	Default off. Once enabled after setup, opening the active route can start Voice automatically.
Pause / Resume / End	Pause stops mic input and playback but does not undo a submitted action. End closes the session.
History	Latest 500 transcript turns on this phone, scoped by user and environment. Clearing history does not delete CRM records or erase live model context.

Audio message for onboarding

“For the best Voice Mode experience, use your phone’s speaker and microphone. Bluetooth or car audio may affect recognition and response time.”

OpenAI provides input noise reduction, but the reviewed documentation does not establish a guaranteed Bluetooth fix. Keep the speaker recommendation until device testing supports a change. [4]

Current release boundaries

Deployment: Voice is staging-gated in the reviewed configuration and uses the reference voice backend. Hosting voice/session and voice/tool in the main backend remains the intended production path. [1]
Known gaps: Unticking a visit failed in prior QA; the contact-discovery handoff opens AI Find Leads; route context can become stale after changes from another client. [2]
Validation: Prior QA exercised tool actions using typed input into a live voice session. It did not certify road noise, Bluetooth, real calls, screen locking or physical-device background audio. This document introduces no new runtime test results. [2]
